Lesson Objectives

- Create an ELT data pipeline with Meltano and Dbt.
- Orchestrate and schedule a data pipeline with Dagster.

Lesson Plan

1. Part 1: Hands-on with ELT
2. Part 2: Hands-on with Orchestration (Demo)

Orchestration - Dagster

Feature	Dagster	Running Scripts
Automation & Reliability	Built-in orchestration, robust error handling	Manual execution, prone to errors
Observability	Rich UI, structured logs, lineage tracking	Minimal, fragmented logs
Data Quality	Asset-centric, built-in quality checks	Manual, limited or absent
Modern Integrations	Native support for data stack tools and platforms	Requires custom, manual integration

dagster

First-class data assets: Orchestration with context

Dagster lets you orchestrate everything in your data platform—not just dbt. You can run ingestion, transformation, and ML workflows in one place, with unified scheduling and observability. When something fails, you'll know exactly where and why.

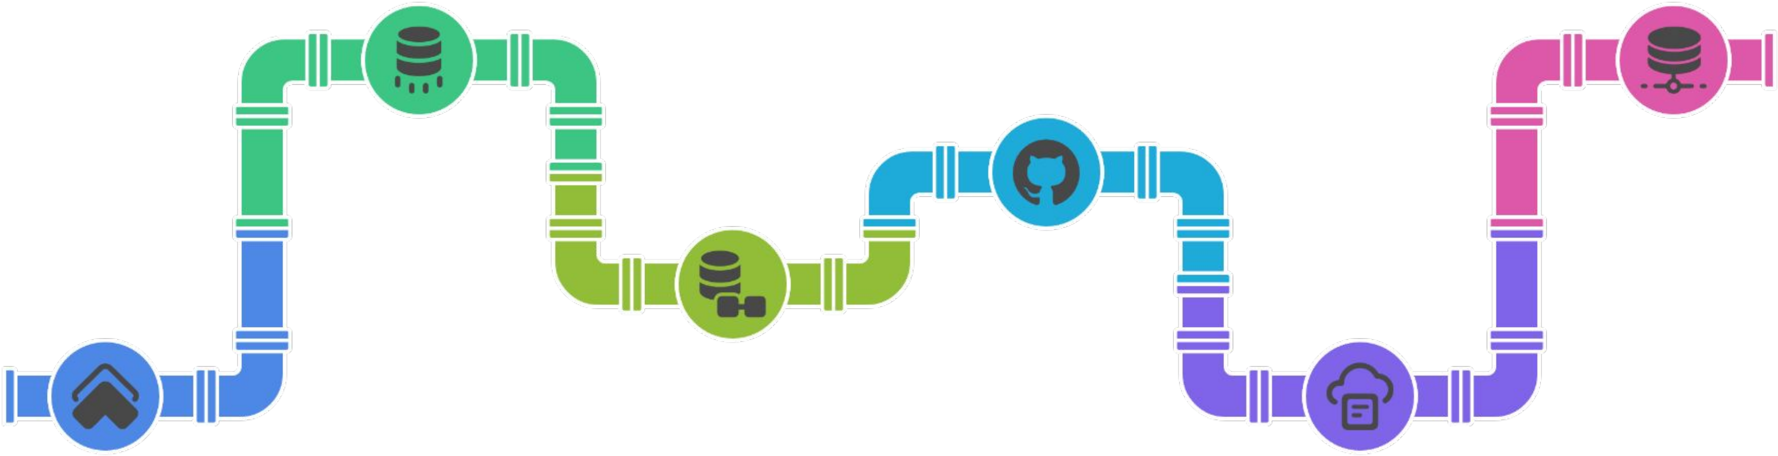
Melanto - Pipeline exercise



01
Create Meltano Project

Initialize a new Meltano project

02
Add GitHub Extractor

Configure an extractor to fetch data from GitHub

03
Add Dummy Loader

Set up a loader to output data to JSON format

04
Test GitHub to JSON

Run a test to ensure data flows correctly from GitHub to JSON

05
Add BigQuery Loader

Configure a loader to load data into BigQuery

06
Add Postgres Extractor

Configure an extractor to fetch data from Postgres

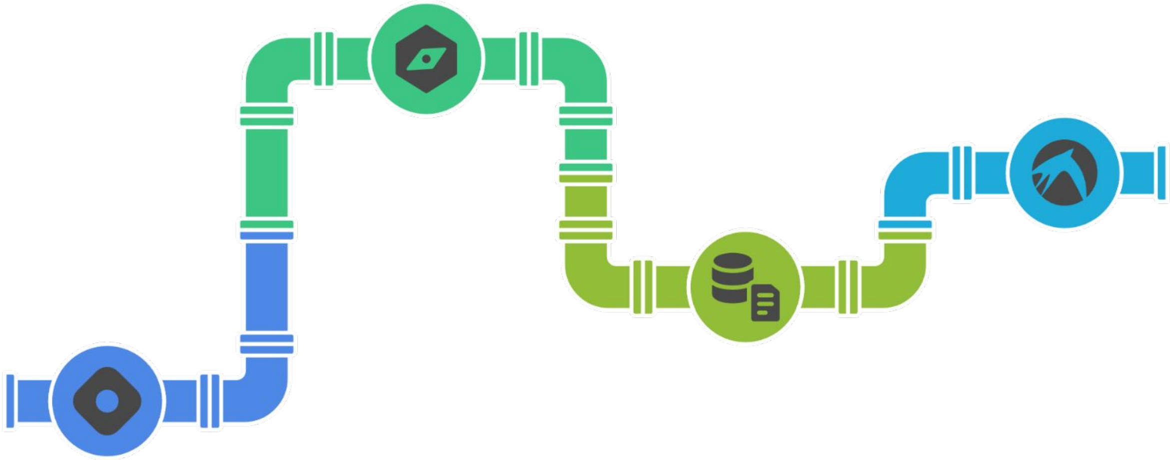
Dbt Project Setup and Execution



01

Activate dwh environment

Activate the data warehouse environment using conda

02

Create new Dbt Project

Initialize a new Dbt project named resale_flat

03

Create source and models

Define data sources and models within the project

04

Run Dbt

Execute the Dbt project to transform data

Dagster Orchestration Part I

Setup Environment
Create and activate a conda environment for Dagster

Create Dagster Project
Scaffold a new Dagster project and navigate to its directory

Configure GitHub Access
Set up environment variables for GitHub API authentication

Create Data Assets
Define data extraction and transformation assets for pandas releases

Define Pipeline Components
Configure job definitions, scheduling, and pipeline dependencies

Run and Monitor Pipeline
Launch Dagster web interface and execute pipeline through UI
